

Analysis

This was the first week for Jimmy to work as a project manager.

The group didn't spend as much time this week compared to earlier iterations in the project, because some of us decided to focus on another course. A large part of this iteration was spent on documentation. Feedback for construction were given to group 2 and the the wiki was updated to prepare for the final handin and delivery to the customer.

Our goal for this week was to test as many of the requirements as possible from the ones implemented last week and try to solve bugs detected during the testing. Sofia carried out the manual test cases for requirements F5, F6, F7 and F47 and then wrote test reports for them. Issues was created on Github for the failed tests and we also managed to solve some of them. Andrew started to load test the server by using the testing tool JMeter. He also wrote tests for SignalR which differs a bit from earlier testing on the server because SignalR uses WebSockets instead of HTTP to communicate.

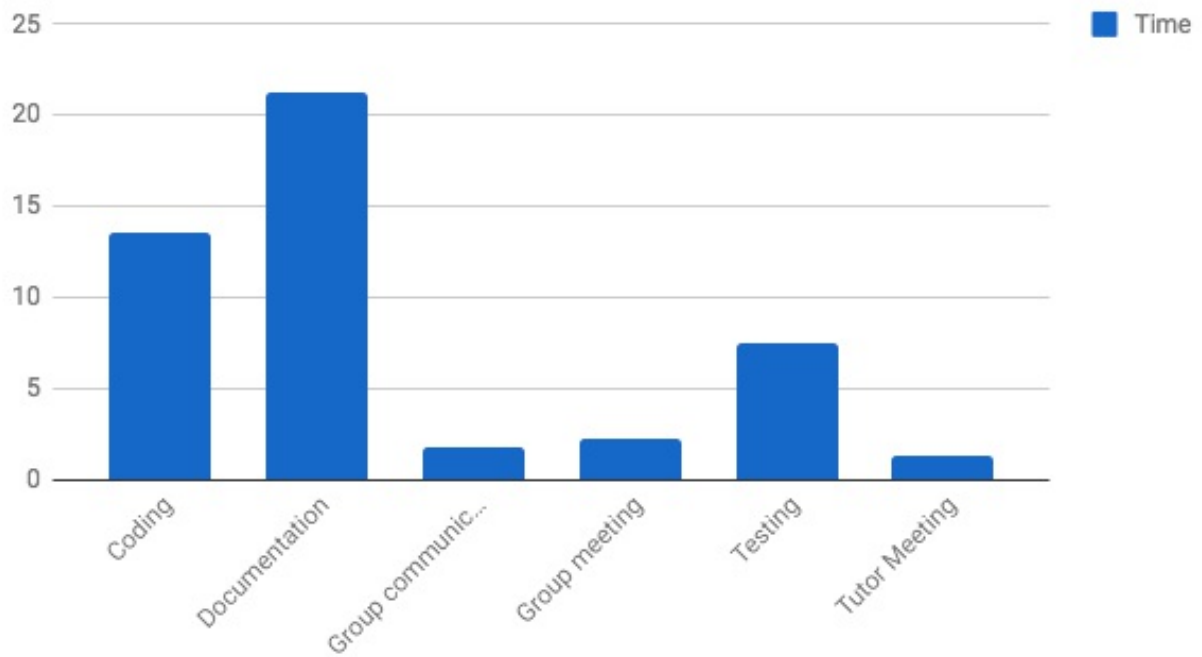

Next iteration, we will focus on more testing, preparing the final presentation and complete the documentation needed for the final handin and delivery to the customer.

Time report iteration 9
